## Introduction

Over the last several years, many corporations have adopted Web-based portals to share information externally - with customers and partners - and internally, among sales, marketing, manufacturing, operations and support personnel. These portals, sometimes known as extra- or intranets, provide secure, customized views of enterprise information, access to select enterprise applications and data-bases, and collaboration facilities to support teamwork within and across companies.

Even as many of these portals evolve into highly personalized Web "dashboards" with access to diverse, modular Web Services, end-users' requirements remain relatively stable. Generally, end-users across an array of industries use both internal and external portals to access multiple enterprise applications and data sources, via personalized and localized interfaces. To be effective, these portals must deliver easy and fast portal navigation, a personalized experience, and high levels of security to protect sensitive corporate data.

To meet these diverse needs, many IT professionals are turning to Enterprise Reporting systems, such as those available from Actuate Corporation, to perform the technically challenging tasks of cross-enterprise data access, seamless information integration, and speedy, intuitive navigation of personalized data views. The Actuate family of products meets these needs with unparalleled levels of flexibility, scalability, and reliability, making Actuate products ideal for large-scale portals serving large numbers of users throughout the enterprise and beyond.

This paper will discuss the role of portals within today's corporate information infrastructures, outline the major requirements for large-scale, intra- and extranet portals, and demonstrate how Actuate's Enterprise Reporting products provide the essential ingredient to enable these portals to serve up fast, seamless access to enterprise information for all types of users.
